

TouchifyMouse

Your phone is now a wireless trackpad.

The getting-started guide: set up in about a minute, then use your phone as a trackpad, keyboard, media remote, microphone and speaker for your Mac or Windows PC.

What TouchifyMouse does

Install a small companion app on your computer and the phone app on your phone. Put both on the same Wi-Fi and your phone controls the computer — everything travels over your own network, in real time.

1

Trackpad

Move, click, right-click, drag and scroll with familiar multi-touch gestures, at the speed you choose.

2

Keyboard

Type with your phone's own keyboard — capitals, symbols, emoji, other languages — plus modifiers, F-keys and one-tap shortcuts.

3

Media remote

Play, pause, skip and mute anything that answers the media keys. The volume slider stays in sync with your computer.

4

Mic & speaker

Use your phone as a microphone in Zoom, Teams or Discord, or play your computer's sound through it.

What you need

A computer

macOS 10.15 or later, or Windows 10/11 (64-bit), running the free TouchifyMouse desktop app.

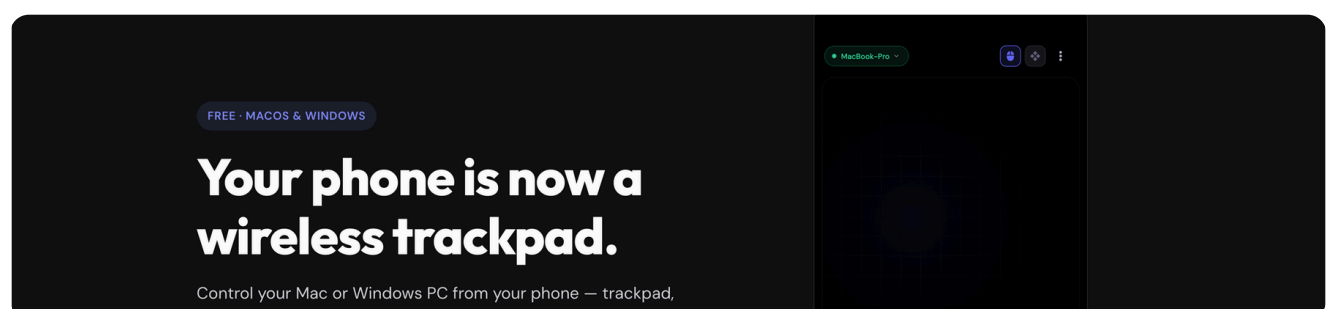

A phone

Android 7.0 or later with TouchifyMouse from Google Play. The iPhone app is coming soon.

One Wi-Fi network

Both on the same network. No account, no cables, nothing goes through the internet.

Free to use. An optional TouchifyMouse Pro upgrade adds Air Mouse (point your phone to move the cursor), Voice Focus and noise suppression for the microphone, and speaker equaliser presets.

Download the desktop app from hamzahussainshah.github.io/touchifymouse.

Install on your computer

1

Download and install the desktop app

macOS — open `TouchifyMouse-mac.dmg` and drag TouchifyMouse to Applications. The app isn't signed with an Apple Developer ID yet, so the first launch needs a right-click on the app → **Open** → **Open**. After that it opens normally and lives in the menu bar.

Windows — run `TouchifyMouse-win-Setup.exe`. SmartScreen may warn about an unknown publisher: choose **More info** → **Run anyway**. When Windows Firewall asks, allow it on **Private networks**. Prefer no installer? Use the portable zip and run `touchifymouse_desktop.exe`.

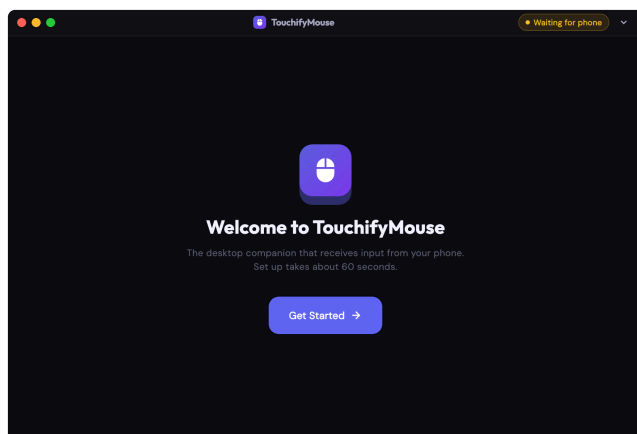

Opening the app twice simply brings the existing window forward — there is only ever one copy running.

2

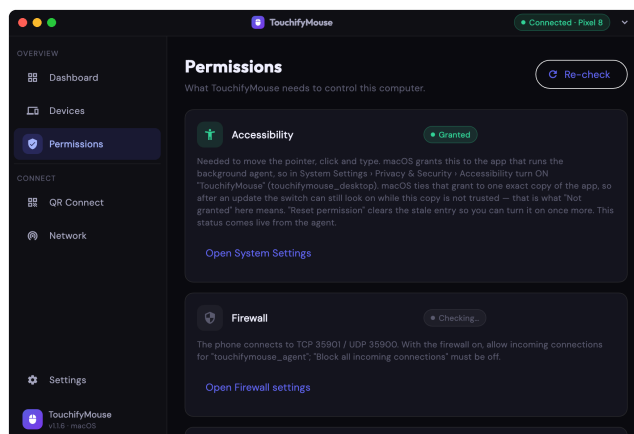

Let it control your Mac (macOS only)

macOS blocks any app from moving the pointer or typing until you allow it. Open **Permissions** in the app and press **Grant**, then switch TouchifyMouse on in **System Settings** → **Privacy & Security** → **Accessibility**. It applies within a second or two — no restart needed. Windows needs nothing here.

Still says “Not granted” with the switch on? macOS ties the permission to one exact copy of the app, so after an update it can point at the old one. Press **Reset permission** on the Permissions screen and turn it on once more.

First launch: the app is waiting for your phone.

Permissions: Accessibility granted, reported live by the app.

Connect your phone

3

Install the phone app

Get TouchifyMouse from Google Play (the iPhone version is on the way) and put the phone on the same Wi-Fi as your computer — that is the only requirement.

4

Connect

Open the app: it looks for computers running the companion and yours appears by itself. Tap it and you're connected. Two other ways, if you need them:

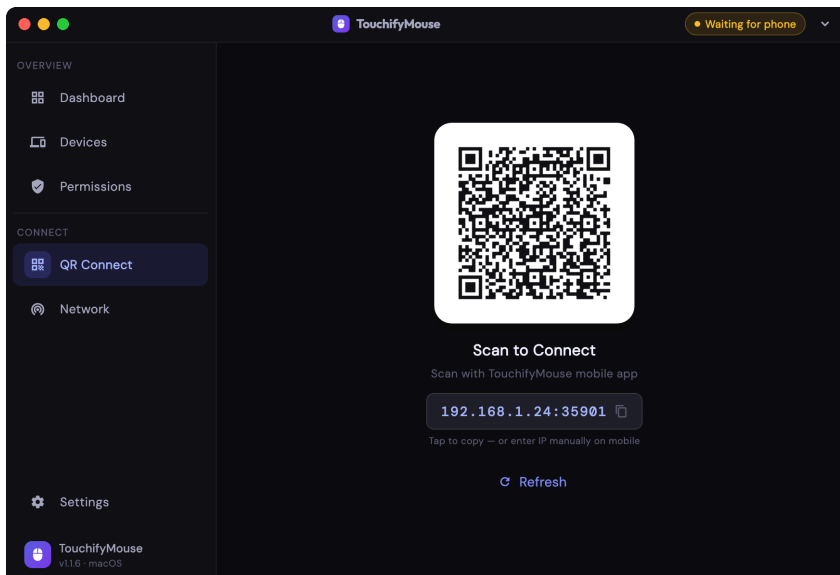

QR code

Tap **Scan QR code** and point the phone at the code on the desktop app's **QR Connect** screen.

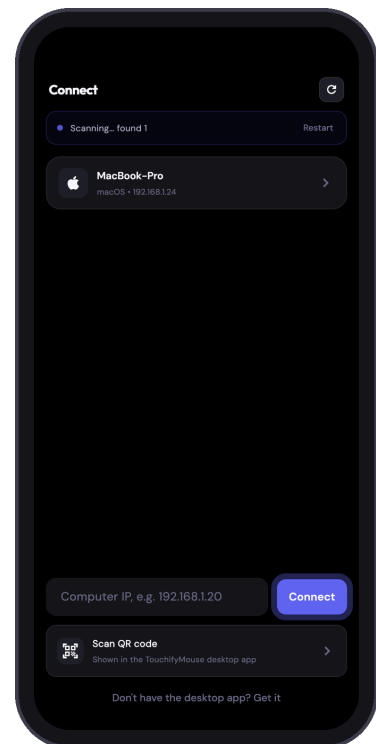

IP address

Type the address shown in the desktop app (for example **192.168.1.24**) into the box at the bottom.

Your computer is remembered, so next time the phone reconnects on its own.

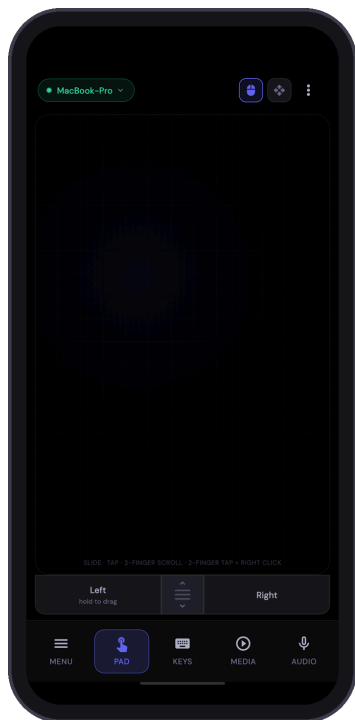

The desktop app's QR Connect screen.

The phone finds your computer.

Trackpad and keyboard

The tabs along the bottom of the phone app switch between the trackpad, keyboard, media remote and audio.

Trackpad

Slide one finger	Move the pointer
Tap	Click
Two-finger tap	Right-click
Two-finger slide	Scroll
Hold Left, then slide	Drag and drop
Scroll strip (middle)	Scroll with one finger

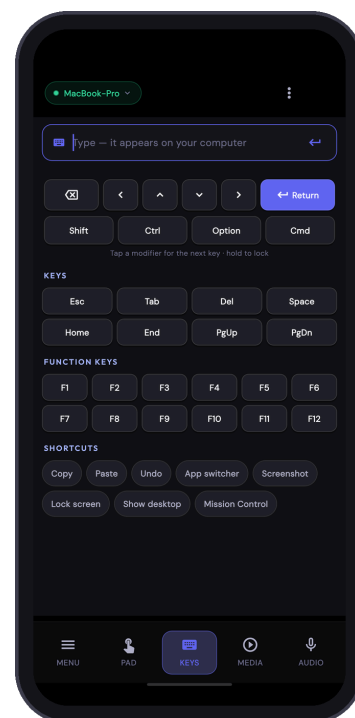

Pointer speed, natural scrolling, left-handed mode and the click buttons are all in Settings.

Keyboard

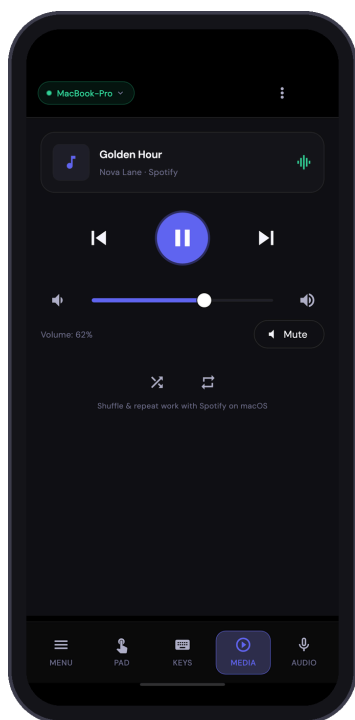

Tap the text field and type with your phone's own keyboard — capitals, symbols, emoji and other languages all arrive exactly as typed.

Modifiers: tap Shift, Ctrl, Option or Cmd to apply it to the next key; hold to lock it. So Cmd then A selects all.

Shortcuts: one tap for copy, paste, undo, screenshot, app switcher, Mission Control or show desktop, plus arrows, Esc, Tab, Home/End, Page Up/Down and F1–F12.

Media, microphone and speaker

Media remote

Play, pause, skip and mute anything that answers the media keys — Music, Spotify, a video in your browser. The volume slider mirrors your computer's volume and moves with it.

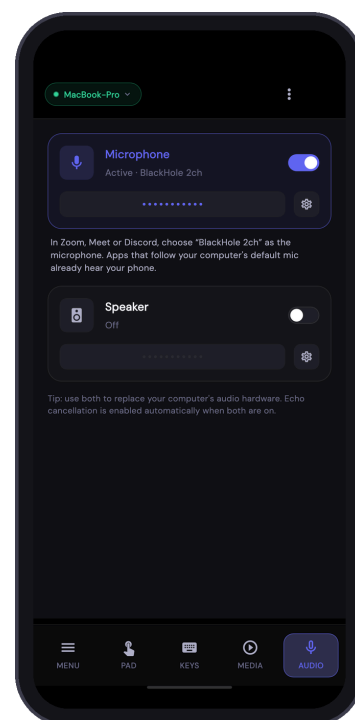

Now-playing details appear for Music and Spotify.

Microphone & speaker

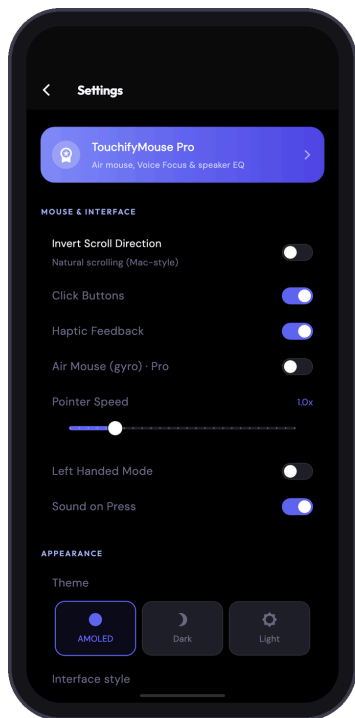

Microphone sends your phone's mic to the computer. **Speaker** sends the computer's sound to your phone. Turn both on and echo cancellation is applied automatically.

The audio device this needs ships **inside** TouchifyMouse — nothing to download. The first time, press **Set up now** (on the phone or in the desktop app) and approve the password or administrator prompt. On Windows, the speaker works straight away with no setup at all.

For calls: Zoom, Meet, Discord and Teams keep their own microphone setting and ignore your computer's default. Pick **BlackHole 2ch** (macOS) or **CABLE Output** (Windows) as the microphone inside that app.

Settings and the desktop app

Phone settings

Appearance

AMOLED, Dark or Light, and two interface styles — Comfortable, or Minimal for a flat, quiet look.

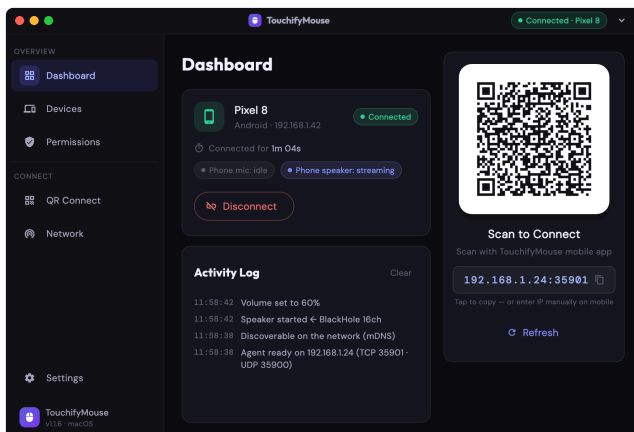

Mouse

Pointer speed, natural scrolling, click buttons, haptics and left-handed mode.

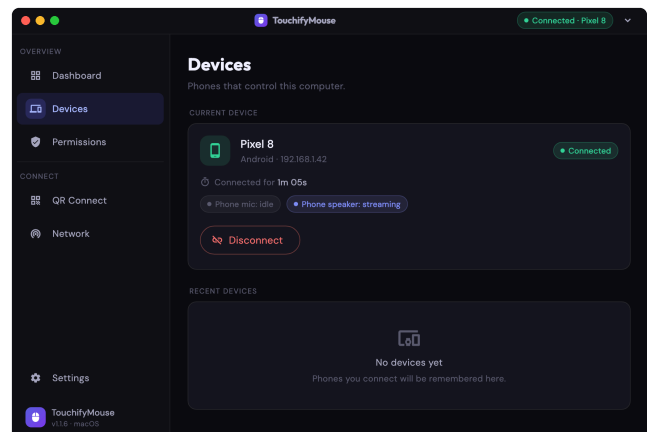

Privacy

Switch anonymous crash reports and the update check off whenever you like.

The desktop app

Dashboard — the connected phone, mic and speaker status, the activity log and a QR code for new phones.

Devices — which phone is in control, for how long, and the phones it remembers.

If something isn't working

The phone doesn't find my computer

Check both devices are on the same Wi-Fi — a phone on mobile data, or a “guest” network, can't see your computer. Some routers block discovery between devices (AP or client isolation); type the IP address shown in the desktop app instead. On Windows, allow TouchifyMouse through the firewall on Private networks.

Connected, but nothing moves or types (macOS)

That is the Accessibility permission. Open Permissions in the desktop app: if it says “Not granted”, press Grant and switch TouchifyMouse on. If the switch already looks on, press Reset permission and turn it on again.

Media keys do nothing

Media control also needs the Accessibility permission. Without it the app can only reach Music and Spotify, so a video in your browser won't respond.

The microphone works but nobody hears me

Your call app is still listening to the built-in microphone. In its audio settings choose BlackHole 2ch (macOS) or CABLE Output (Windows).

The audio device is still missing after setup (Windows)

Windows sometimes only shows a new audio device after a restart. Restart your computer, then turn the microphone on again — the app tells you when this is needed.

The connection drops when the screen locks

Some phones — Xiaomi, OPPO, Samsung and others with aggressive battery management — freeze apps in the background. Allow TouchifyMouse to run in the background, or turn battery optimisation off for it. Reopening the app reconnects immediately.

Sound is choppy or delayed

Audio needs a steady Wi-Fi link. Move closer to the router, prefer 5 GHz, and avoid using the microphone and speaker at once on a busy network.

Private by design. Your phone talks directly to your computer over your local Wi-Fi — trackpad input, keystrokes and audio never reach us. The app sends anonymous crash reports (you can switch them off) and checks the website for new versions.

Still stuck? Email aitools.deventiatech@gmail.com and say which computer and phone you're using.
